The basic idea:-

- user pastes text of a recipe from a blog, message or email
- App sends text to API {Gemini}
- AI returns JSON with title, ingredients, steps.
- User can review it, edit things if the AI messed up, and save it to the app.

2. Things it need to do

- Text box needs to work, reject empty input.
- Call gemini securely from the server (not client side).
- Show an editable draft screen.
- Allow saving or discarding.
- Handle errors: what if Gemini is down, slow, or gives weird garbage text.
- Need a rate limit so people doesn't spam the API Key.

Non-functional / Constraints:

- Fast enough
- Keep API key secret
- Privacy: don't log user text or send personal info.

User Stories

- As a home cook..... I want to paste text so I dont have to retype. I want to edit before saving so AI's mistake doesn't ruin my cookbook. I wat clean message if Gemini fails.

Tbh. when I tried to create a website to test the API before I add it to the application; I failed to do so; it didn't
